Mobile App Design Justification

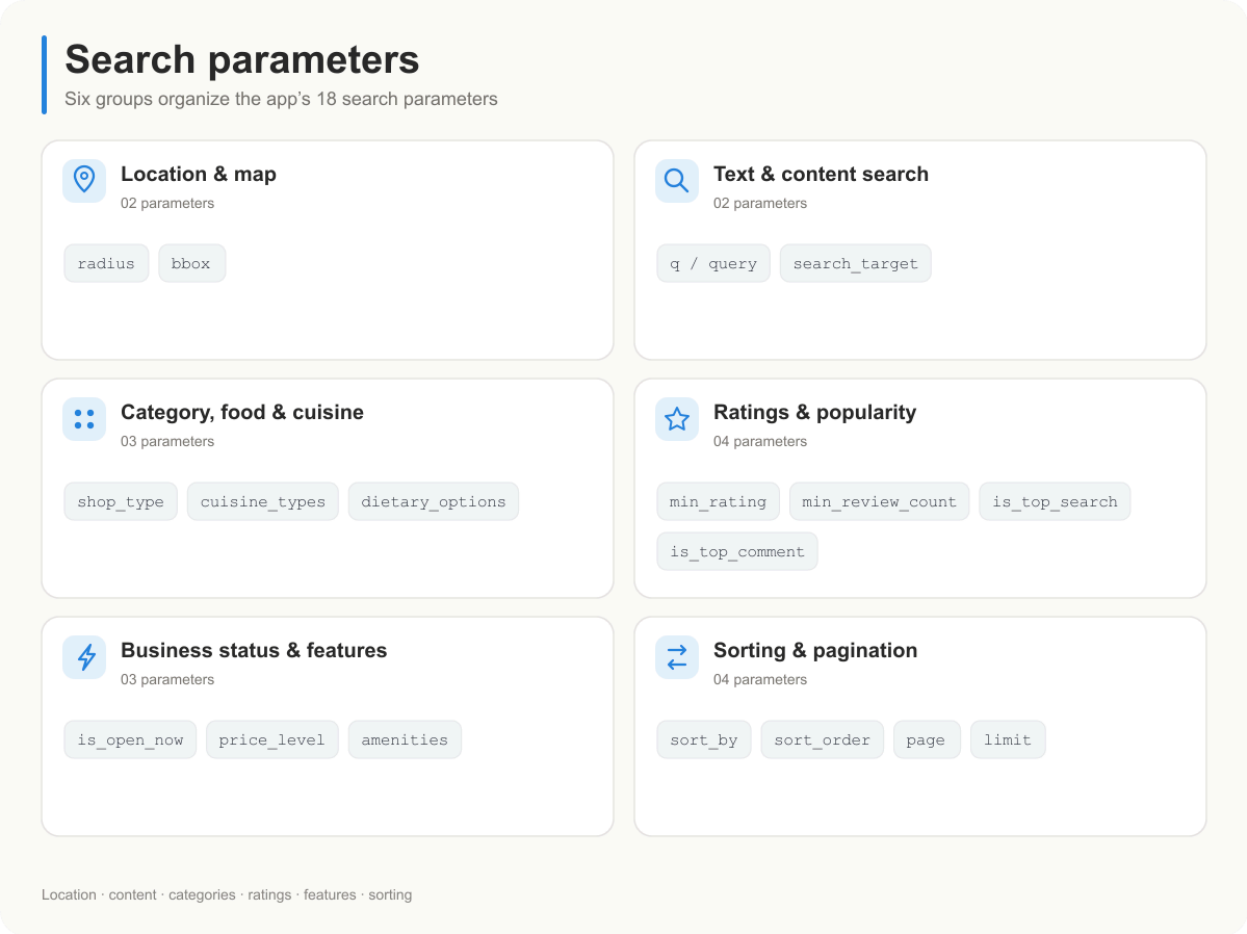

Problem Definition & Solution Vision

In traditional map apps, users can struggle to find the right venue among thousands of options. Our design reduces cognitive load by combining location-based search with practical filters—such as student-friendly pricing, power outlets, Wi-Fi quality, and budget—so users can find a suitable place quickly.

1. Information Architecture & Variable Management

The app uses backend parameters to support location, text and category searches, ratings, business status, sorting, and pagination.

Search Parameters

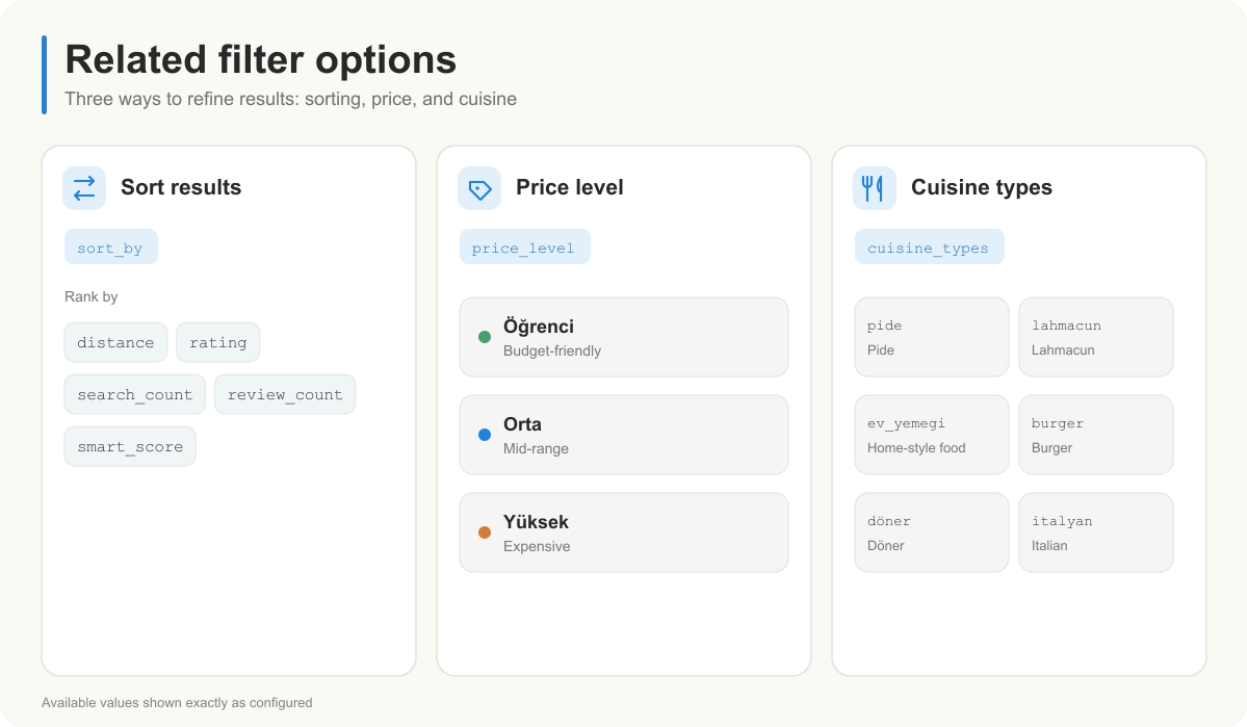

Visual overview of the app's 18 search parameters

2. Advanced Search & Filtering

The Advanced Search screen lets users refine results by shop and cuisine type, price level, search radius, and amenities such as student discounts, power outlets, and outdoor seating. Checkboxes and sliders make it easy to combine preferences.

Related Filter Options

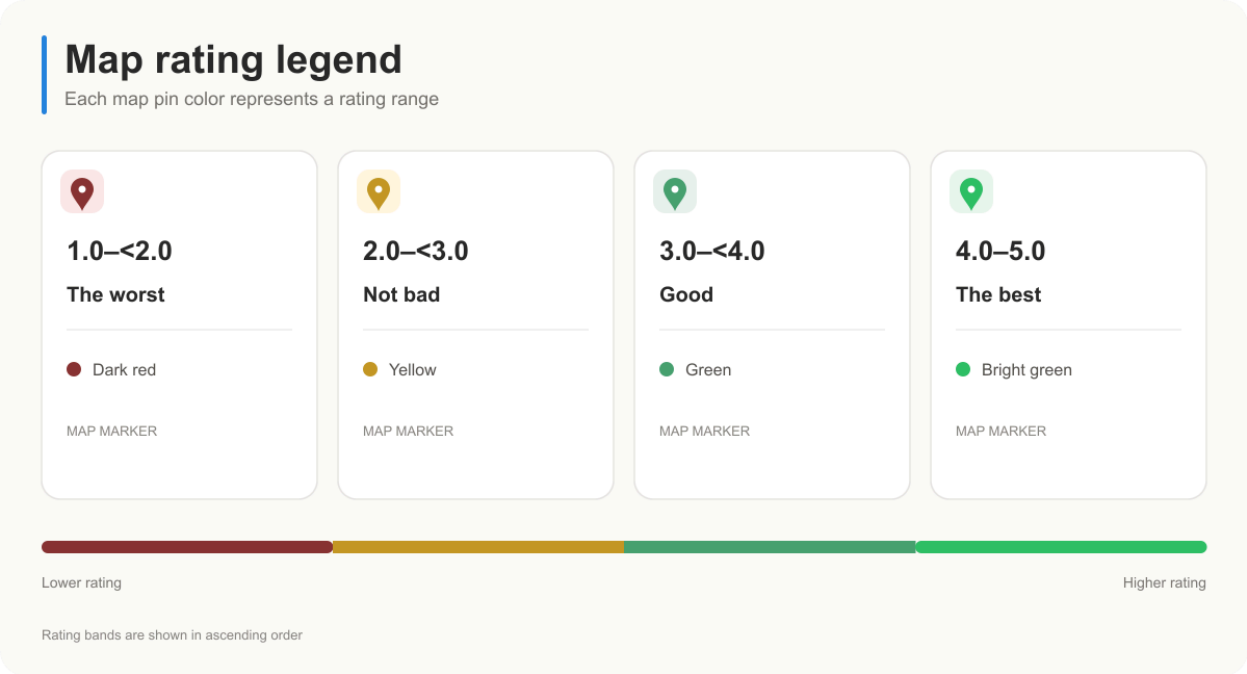

Visual overview of sorting, price levels, and cuisine options

3. Color-Coded Map Markers

colored pins help users distinguish venue status (open or closed), popularity, and special states such as starred venues. This color system makes the map easier to scan without relying on text.

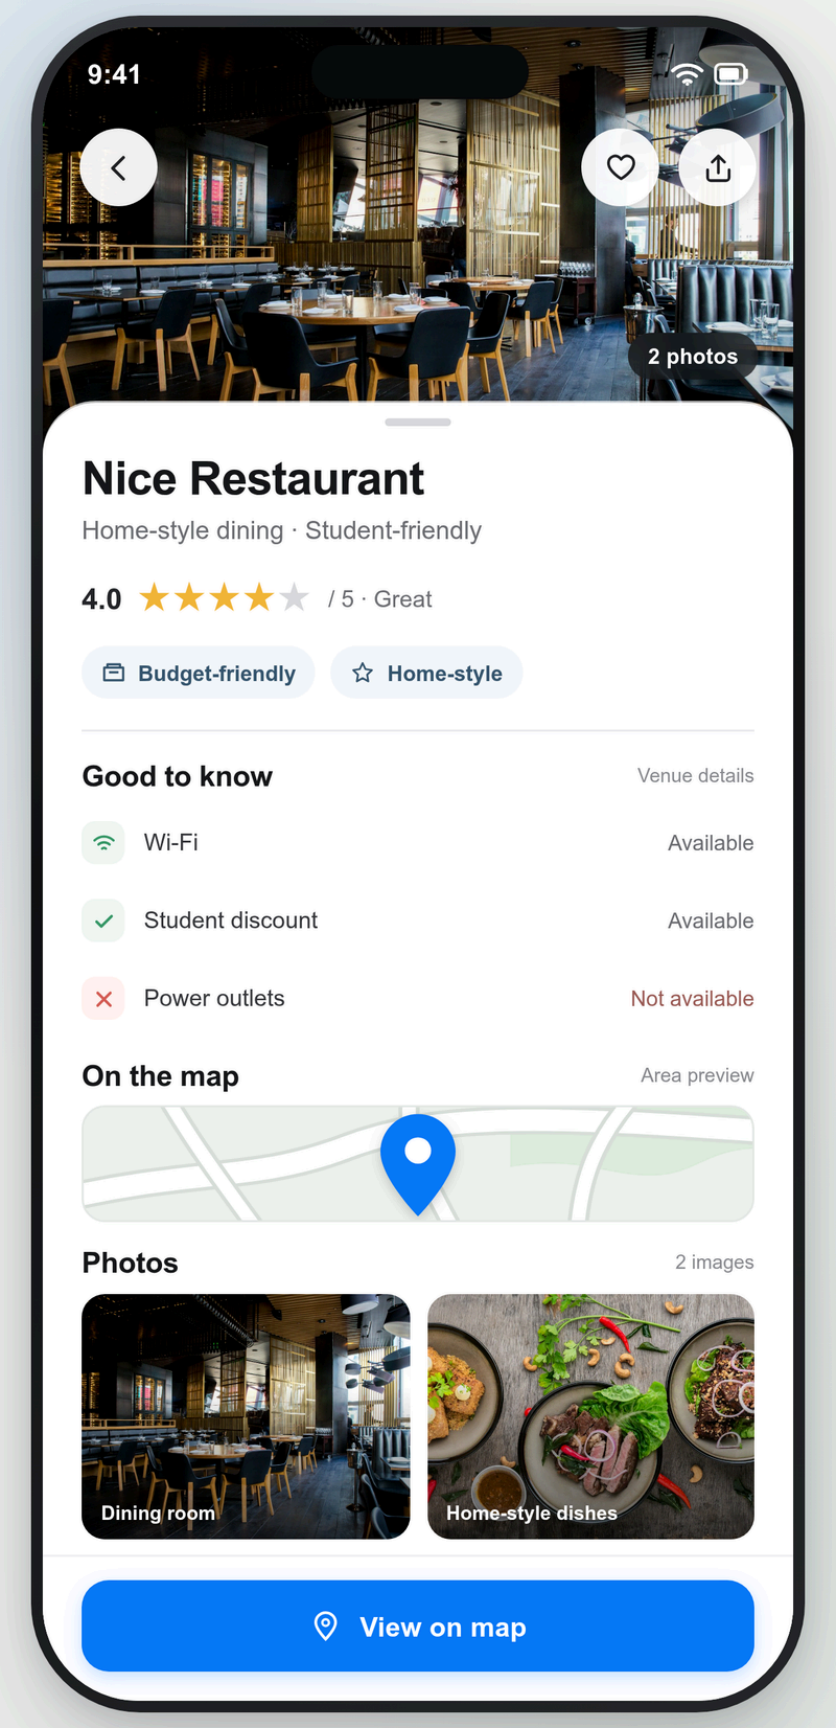

Map Rating Legend

Visual overview of the four rating bands and map-marker colors

4. Detail View & Information Density

The Information Frame brings together the details users need to choose a venue: ratings, scannable feature indicators, and a visual gallery—all in one scrollable view.

Design Elements & Justification

Search bar at the top

Keeps search accessible and gives users a clear way to find or switch restaurants.

Prominent restaurant title

Makes the page's main subject immediately recognizable.

Rating and review summary

Offers a quick snapshot of overall quality without requiring users to read detailed reviews first.

Restaurant criteria with check and cross icons

Makes key attributes easy to compare at a glance. The icons provide a simple visual signal alongside the text.

Restaurant image section

Lets users preview the venue, food, or atmosphere, adding context to the written information.

Card-based layout and spacing

Groups related details together and separates them from other sections, making the page easier to scan on a small screen.
